1. Introduction

Queue management has become a significant challenge in hospitals, banks, government offices, and other public service organizations. Traditional manual queue systems cause long waiting times, overcrowding, and poor customer satisfaction.

The **Smart Queue Appointment System** is a web-based application developed to digitalize queue management by allowing customers to reserve appointments online, receive queue numbers, monitor queue status, and view their appointment history.

2. Problem Statement

Many organizations still rely on manual token systems.

Problems include:

- Long waiting times
- Overcrowded waiting areas
- Customers unsure about their queue position
- Time wastage
- Difficult queue management
- No online booking system
- No appointment history

3. Objectives

3.1 Main Objective

Develop an online Smart Queue Appointment System using Object-Oriented Programming concepts.

3.2 Specific Objectives

- Allow users to register and login
- Book appointments online
- Generate queue tokens automatically
- Display live queue information
- Maintain appointment history
- Improve customer experience
- Reduce waiting time

4. Proposed Solution

The proposed system provides an online platform where customers can:

- Create an account
- Login securely
- Select a service
- Book appointments
- Receive queue numbers
- View live queue status
- Access booking history
- Manage their profile

Administrators can manage queues and appointments efficiently.

5. Technologies Used

Component	Technology
Frontend	HTML5
Styling	CSS3
Client-side	JavaScript
Backend	Node.js
Architecture	REST API
Data Storage	JSON File Database (Can be upgraded to MySQL)
Version Control	Git & GitHub

6. System Features

6.1 User Authentication

- User Registration
- User Login
- Logout
- Session Management

6.2 Dashboard

Displays

- User information
- Upcoming appointments
- Queue statistics
- Navigation panel

6.3 Appointment Booking

Users can

- Choose service
- Select appointment date
- Select appointment time
- Submit booking

6.4 Queue Management

System automatically

- Generates queue numbers
- Displays queue position
- Shows waiting status
- Updates queue progress

6.5 Ticket Generation

After booking

- Queue number generated
- Appointment details shown
- Booking confirmation displayed

6.6 History

Users can

- View previous bookings
- View completed appointments
- Track appointment records

6.7 User Profile

Users can update

- Name
- Email
- Password
- Personal information

6.8 Admin Authentication

Admin can view queue status and cancel appointments.

7. Object-Oriented Programming Concepts

The project follows Object-Oriented Programming principles.

7.1 Encapsulation

Sensitive user information is managed securely through classes and modules.

Example:

- User class
- Ticket Handler
- Authentication Handler

7.2 Abstraction

Complex backend operations are hidden from users.

Examples:

- Queue generation
- Authentication
- Booking process

7.3 Inheritance

Future versions can include:

User

Customer

Administrator

Both inherit common properties from the User class.

7.4 Polymorphism

Different service handlers perform booking differently.

Examples

- Hospital Handler
- Bank Handler
- Ticket Handler

Each processes requests uniquely while using a common structure.

8. System Architecture

9. Database Design

9.1 User Table

Field	Type
UserID	Integer
Name	Varchar
Email	Varchar
Password	Varchar

9.2 Appointment Table

Field	Type
AppointmentID	Integer
UserID	Integer

Field	Type
Service	Varchar
Date	Date
Time	Time
QueueNumber	Integer
Status	Varchar

9.3 Queue Table

Field	Type
QueueID	Integer
QueueNumber	Integer
CurrentPosition	Integer
Status	Varchar

10. System Interfaces

The project contains the following pages:

- Login Page

SmartQueue

Welcome back — login to continue

Email

Login

Don't have an account? [Register here](#)

The login form is centered on a light gray background. It features the SmartQueue logo at the top, followed by a welcome message. Below are input fields for email and password, with a toggle icon for password visibility. A blue 'Login' button is positioned below the password field. At the bottom, there is a link to register for new users.

- Registration Page

Create Account

Full Name

Email

Phone

07XXXXXXXX

Password

Minimum 8 characters.

Confirm Password

Register

Already have an account? [Login here](#)

The registration form is centered on a light gray background. It includes input fields for full name, email, and phone number (with a placeholder '07XXXXXXXX'). There are two password fields: one for the password and another for confirmation. A note 'Minimum 8 characters.' is placed below the first password field. A blue 'Register' button is located below the confirmation password field. At the bottom, there is a link to login for existing users.

Token	Type	Details	Date / Time	Status	Action
1	 Bank	Ceylon Commercial Bank Cash Deposit	2026-07-19 (N/A)	Waiting	X Cancel
1	 Hospital	Green Valley Clinic Dr. Malith Gunasekara	2026-07-23 (N/A)	Waiting	X Cancel
1	 Hospital	City General Hospital Dr. Nadeesha Perera	2026-07-20 (N/A)	Waiting	X Cancel

11. Testing

Test Case	Expected Result	Status
User Registration	New account created	Passed
User Login	Login successful	Passed
Book Appointment	Appointment created	Passed
Queue Generation	Queue number assigned	Passed
View Queue	Queue displayed	Passed
View History	Booking history shown	Passed
Logout	Session terminated	Passed

12. Future Improvements

Future enhancements include:

- MySQL database integration
- Java Spring Boot backend
- Email notifications
- SMS reminders
- QR code tickets
- AI-based waiting time prediction
- Mobile application (Android & iOS)
- Online payment integration
- Admin analytics dashboard
- Real-time queue updates using WebSockets

13. Conclusion

The Smart Queue Appointment System successfully addresses the inefficiencies of traditional queue management by providing a web-based digital solution. Users can conveniently register, book appointments, receive queue numbers, monitor queue status, and access booking history. The project demonstrates the effective use of Object-Oriented Programming principles, modern web technologies, and modular system design, making it scalable for future enhancements and suitable for real-world deployment.
